MEMORANDUM 4629

**Title: EXECUTABLE TRANSFORMATIONAL RULES FROM
CORE ELLA TO THE KERNEL**

Authors: M G Hill, J D Morison

Date: July 1992

Summary

This document describes the set of formal transformation rules which have been implemented for mapping Core ELLA into Kernel data structures. Examples are given of circuits which have been successfully transformed by the implementation.

1 Introduction

In this memorandum we give the formal definition of the Lisp implementation of the transformational rules from Core ELLA to the **Kernel**. In the document [MH91] a formal description was given of transformational rules from Core to Kernel. These rules were then implemented in the language Lisp. In the implementation of these rules a number of revisions were undertaken, the most profound being the way in which the transformational environment was handled and in the updating of the scoping rules. This has meant that the definition of a significant number of the transformational rules have changed. It is the purpose of this document to formally describe the actual functions and transformational rules which have been implemented. In order to aid readability the rules will be specified in the VDM notation [Jon90]. The reader is referred to [MH91] for a complete description of the background to this document.

This memorandum describes the static semantics for the Core of the latest version of ELLA, namely ELLA2000. In order to get the complete description of the Core language the dynamic semantics must also be considered. In reference [Hil92] a description of the dynamic semantics of the **Kernel** is given and interested readers are referred to that document.

2 The Kernel

The **Kernel** is a set of data structures into which any Core ELLA description can be mapped, for a complete description of Core ELLA and its relation with the **Kernel** the reader is referred to [MH91]. A Glossary of symbols, the definitions of Core ELLA, and the **Kernel** data structures are given in appendices A, B and C, with the transformational signatures given in appendix D.

Central to the transformation of Core ELLA descriptions is the transformational environment. For completeness the definition of the environment is given in appendix E. In the work described in [MH91] the environment appeared within the transformational rules. In the work described here the environment is updated through side-effects and thus only the following need to be considered.

Env (the current environment)

Envstack (a stack of environments)

The **Envstack** hold all the necessary environments when local declarations are encountered.

When beginning translation the initial environment contains only empty declarations i.e.

$$\text{InitialEnv} = ([],[],[],\{\},\{\},\{\},\{\},\{\},\{\},\{\},\{\}) \in \text{Env}$$

3 Scopes

The scopes of Core ELLA are removed by the transformation to the **Kernel**. In order to achieve this the following operators are needed

The setting of the global environment

```
SetEnv(e: Env)b:B
ext wr Env: Env
post b  $\Leftrightarrow$  Env = e
```

The stacking of the global environment onto the local environment stack

```
Stackenv()b:B
ext rd Env: Env
wr Envstack: EnvStack
post b  $\Leftrightarrow$  Envstack = [ Env]  $\sim$  Envstack
```

The unstacking of the local environment stack

```
Unstackenv()b:B
ext wr Envstack: EnvStack
post b  $\Leftrightarrow$  Envstack = t! Envstack
```

The obtaining of the last local environment to be stacked

```
Hdstack()e: Env
ext rd Envstack: EnvStack
post e = hd Envstack
```

We now present operators which define the environment when entering and leaving declarations.

```
Scope-Fn-Begin()
ext rd Env: Env
pre Stackenv
post SetEnv( env( Env.typedec, Env.fndec, [],
Env.fnmap  $\uparrow$  Env.lclfnmap, { },
Env.tynamemap  $\uparrow$  Env.lcltynamemap, { },
{ }, { },
{ }, { }, {}))
```

Scope-Fn-End()

ext rd Env: Env

post SetEnv(env(Env.typedec, Env.fndec, (Hdstack).sigdec,
 (Hdstack).fnmap, (Hdstack).lclfmap ↑ Env.lclfmap,
 (Hdstack).tynamemap, (Hdstack).lclynamemap ↑ Env.lclynamemap,
 (Hdstack).signamemap, (Hdstack).lclynamemap,
 (Hdstack).usedtynname, (Hdstack).usedfnname, (Hdstack).usedsigname))

 ^ Unstackenv

Scope-Begin()

ext rd Env: Env

pre Stackenv

post SetEnv(env(Env.typedec, Env.fndec, Env.sigdec,
 Env.fnmap ↑ Env.lclfmap, {}),
 Env.tynamemap ↑ Env.lclynamemap, {}),
 Env.signamemap ↑ Env.lclysname, {}
 {}, {}, {}))

Scope-End()

ext rd Env: Env

post SetEnv(env(Env.typedec, Env.fndec, Env.sigdec,
 (Hdstack).fnmap, (Hdstack).lclfmap,
 (Hdstack).tynamemap, (Hdstack).lclynamemap,
 (Hdstack).signamemap, (Hdstack).lclynamemap,
 (Hdstack).usedtynname (Hdstack).usedfnname (Hdstack).usedsigname))

 ^ Unstackenv

Scope-End-Add-Fn()b:B

ext rd Env: Env

post b ⇔

SetEnv(env(Env.typedec, Env.fndec, (Hdstack).sigdec,
 (Hdstack).fnmap, (Hdstack).lclfmap,
 (Hdstack).tynamemap, (Hdstack).lclynamemap,
 (Hdstack).signamemap, (Hdstack).lclynamemap,
 (Hdstack).usedtynname (Hdstack).usedfnname (Hdstack).usedsigname))

Local-Scope-Rule : *Name* → \mathbb{B}

```

Local-Scope-Rule(name)  $\triangleq$ 
  if name ∈ Env.signamemap
    then SetEnv( $\mu$ ( Env, {usedsigname → Env.usedsigname † {name}}))
  else if name ∈ Env.tynamemap
    then SetEnv( $\mu$ ( Env, {usedtynname → Env.usertynname † {name}}))
  else if name ∈ Env.fnamemap
    then SetEnv( $\mu$ ( Env, {usedfnname → Env.usertfnname † {name}}))
  else true

```

The stacking and unstacking of the scopes for BEGIN..END clauses is carried out through the transformation rule [CC3]. Whilst the stacking and unstacking of local function and type declarations are carried out through the transformation rules [SP1] and [SP2]. The Local Scope Rule ensures that any name only has one meaning per scope.

4 Transformational Functions

In this section we present functions which will be used by the transformational rules.

4.1 Join Checks

The *Check-Joins* predicate is used to ensure that all local signals in an Environment have been joined.

Check-Joins : $\emptyset \rightarrow \mathbb{B}$

```

Check-Joins()  $\triangleq$   $\forall s \in \text{rng Env.lclsigname}_{map} \cdot s.\text{sort} = \text{joined}$ 

```

4.2 Two Value Types

Here we present the predicate for checking that a type is a two valued enumerated type:

Check-Two-Val : *kType* → \mathbb{B}

```

Check-Two-Val(ty)  $\triangleq$ 
  let typeno(typeno) = ty in
  let (Env.tydedec)[typeno].new = tags(TagSeq) in
    len(tags(TagSeq)) = 2

```

4.3 Check names

These predicates ensure that a particular name is not already in scope. They will be used by the functions that add names to an Environment.

Check-Fn: Fnname → B

Check-Fn(flname) △
 $\text{fnname} \notin (\text{dom}(\text{Env.lclfnmap}) \cup \text{Env.usedfnname})$

Check-Typename: Name → B

Check-Typename(name) △
 $\text{name} \notin (\text{dom}(\text{Env.lcltypnamemap}) \cup \text{Env.usedtypename})$

Check-Signal: Signalname → B

Check-Signal(signalname) △
 $\text{signalname} \notin (\text{dom}(\text{Env.lclsignamemap}) \cup \text{Env.usedsignalname})$

4.4 Adding Names to an Environment

These functions define the addition of names to an environment

Add-Fn: Fndec → B

Add-Fn(fd) △
let Len = len Env.fndec in
let FnName = fd.fnname in
 $\text{SetEnv}(\mu(\text{Env}, \{ \text{fndec} \rightsquigarrow \text{Env.fndec} \wedge [fd],$
 $\text{lclfnmap} \rightsquigarrow (\text{Env.lclfnmap} \uplus \{ \text{FnName} \rightarrow \text{Len} + 1 \}))$
}))

pre *Check-Fn(fd.fnname) ∧ Scope-End-Add-Fn*

Add-Type: Typedecl → B

Add-Type(td) △
let Len = len Env.typedec in
let TyName = td.typename in
 $\text{SetEnv}(\mu(\text{Env}, \{ \text{typedec} \rightsquigarrow \text{Env.typedec} \wedge [td],$
 $\text{lcltypnamemap} \rightsquigarrow$
 $(\text{Env.lcltypnamemap} \uplus \{ \text{TyName} \rightarrow \text{typeno}(\text{Len} + 1) \}))$
}))

pre *Check-Typename(td.typename) ∧ Check-Signal(td.typename)*

Add-Signal: Signaldec × Sort → B

Add-Signal(sd, sort) △

let Len = len Env.sigdec in
let SigName = sd.signalname in

SetEnv(μ(Env, { sigdec ↦ Env.sigdec ∪ [sd],
lclsignamemap ↦
(Env.lclsignamemap † {SigName ↦ sig(Len + 1, sort)})
}))

pre Check-Signal(sd.signalname) ∧ Check-Typename(sd.signalname)

Add-Join: Signaldec × Signalno → B

Add-Join(sd, signalno) △

let SigName = sd.signalname in

SetEnv(μ(Env, { sigdec[signalno] ↦ sd,
lclsignamemap ↦ (Env.lclsignamemap † {SigName ↦
sig(signalno, joined)})
}))

Add-Tag: Tagname → B

Add-Tag(tagname) △

let Len = len Env.typedec in

SetEnv(μ(Env, { lcltypnamemap ↦
(Env.lcltypnamemap † {tagname ↦ consttag(Len + 1)})
}))

pre Check-Typename(tagname) ∧ Check-Signal(tagname)

Add-Type-Name: Typename × kType → B

Add-Type-Name(typename, ktype) △

SetEnv(μ(Env, { lcltypnamemap ↦

(Env.lcltypnamemap † {typename ↦ typename(typename, ktype)})
}))

pre Check-Typename(typename) ∧ Check-Signal(typename)

4.5 Finding Names in an Environment

These functions describe how any name can be located within an Environment

Find-Lower-Nm: Name → Typetag ∪ Sig

Find-Lower-Nm(name) △

(Env.signamemap † Env.tynamemap † Env.lclsignamemap † Env.lcltypnamemap)(name)

pre Local-Scope-Rule(name)

Find-Type-or-Alt: Name → kType ∪ kEnum

Find-Type-or-Alt(name) △

```
let ans = Find-Lower-Nm(name) in
if ans = consttag(..)
then Find-Alt(name)
else Find-Type(name)
```

Find-Sig-or-Alt: Name → (kUnit × kType) ∪ kEnum

Find-Sig-or-Alt(name) △

```
let ans = Find-Lower-Nm(name) in
if ans = sig(..)
then Find-Signal(name)
else Find-Alt(name)
```

Find-Fn: Fnname → Fnno

Find-Fn(name) △

```
(Env.fnmap † Env.lclfnmap)(name)
```

pre Local-Scope-Rule(name)

Find-Unjoined: Signalname → Fnno

Find-Unjoined(signalname) △

```
let Signo = (Env.lclsignamemap)(signalname).signalno in
let signaldec(signalname, type, instance(fnno, ..)) = (Env.sigdec)[Signo] in
fnno
```

pre (Env.lclsignamemap)(signalname).sort = unjoined

Find-Type: Typename → kType

Find-Type(typename) △

Find-Lower-Nm(typename)

pre Find-Lower-Nm(typename) ∈ (typename ∪ typeno)

Find-Alt: Altname → kEnum

Find-Alt(altname) △

```
let consttag(ktypeno) = Find-Lower-Nm(altname) in
let typedec(.., tags(tags)) = (Env.typedec)[ktypeno] in
let index = i (i ∈ inds tags) · tags[i] = tag(altname, ..) in
enum(ktypeno, index)
```

Find-ELLAint: Tagname → Typeno × Lowerbound × Upperbound

Find-ELLAint(tagname) △

```
let consttag(ktypeno) = Find-Lower-Nm(tagname) in
let typedec(., ellaint(., lb, ub)) = ( Env.typedec)[ktypeno] in
    ktypeno, lb, ub
```

Find-Integer-Type: kType → Tagname × Lowerbound × Upperbound

Find-Integer-Type(ktype) △

```
cases ktype of
    typeno(typeno) → cases ( Env.typedec)[typeno] of
        typedec(., ellaint(t, l, u)) → t, l, u
    end
```

typename(., type) → Find-Integer-Type(type)

end

Find-Char: Tagname × Char → kEnum

Find-Char(tagname, char) △

```
let consttag(ktypeno) = Find-Lower-Nm(tagname) in
let typedec(., chars(., chs)) = ( Env.typedec)[ktypeno] in
let index = i(i ∈ inds chs) · chs[i] = char in
    enum(ktypeno, index)
```

Find-Signal: Signal → kUnit × kType

Find-Signal(signalname) △

```
let sig(signalno, .) = Find-Lower-Nm(signalname) in
    signal(signalno), ( Env.sigdec)[signalno].type
```

Find-Assoc: Altname → kType

Find-Assoc(altname) △

```
let consttag(ktypeno) = Find-Lower-Nm(altname) in
let typedec(., tags(tags)) = ( Env.typedec)[ktypeno] in
    i(ktypeOpt ∈ kTypeOpt) · tag(altname, ktypeOpt) ∈ elems tags
```

Find-Row: kType → N₁ × kType

Find-Row(ktype) △

```
let ty = Get-Types(ktype) in
let types(types) = ty in
let size = len(types) in
(size, types[1])
```

pre $\forall i \in \{1..size\} \cdot types[1] = \boxed{T} = types[i]$

Find-Biop: Biopname × kType × kType → kFnbody

Find-Biop(name, ktype₁, ktype₂) △

```
let biopinfo = i (i ∈ BiopEnv.biop) · i.biopname = name in
biop(name)
```

pre *Biop-Type-Equals(biopinfo.inputtype, ktype₁) ∧*
Biop-Type-Equals(biopinfo.outputtype, ktype₂)

4.6 Removing Type Aliasing

Type aliasing is removed by means of the following function:

Get-Type : kType → kType

Get-Type(ty) △

```
cases ty of
types([ktype1, ..., ktypek]) → types([Get-Type(ktype1), ..., Get-Type(ktypek)]),
typename(_, ktype) → Get-Type(ktype)
stringtype(size, ktype) → stringtype(size, Get-Type(ktype))
others ty
end
```

4.7 Type Checking

Type checking is an important aspect of the ELLA compiler and the relation ' $a = \boxed{T} = b$ ' shows how the transformation from Core ELLA to the Kernel will define type equality. This relation is defined by:-

$$ktype_1 = \boxed{T} = ktype_2 \Leftrightarrow Type-Equals(ktype_1, ktype_2)$$

where

Type-Equals : $kType \times kType \rightarrow \mathbb{B}$

```

Type-Equals( $ty_1, ty_2$ )  $\triangleq$ 
  cases (Get-Type( $ty_1$ ), Get-Type( $ty_2$ )) of
    ( typeno( $typeno_1$ ), typeno( $typeno_2$ ))  $\rightarrow$  ( $typeno_1 = typeno_2$ )
    ( stringtype( $s_1, tn_1$ ), stringtype( $s_2, tn_2$ ))  $\rightarrow$  ( $s_1 = s_2 \wedge Type-Equals(tn_1, tn_2)$ )
    ( types([ $t_1, \dots, t_k$ ]), types([ $s_1, \dots, s_j$ ]))  $\rightarrow$   $j = k \bigwedge_{i=1..k} Type-Equals(t_i, s_i)$ 
    ( typevoid, typevoid)  $\rightarrow$  true
    others false
  end

```

For the Built in Operators (Biops) the type of the enclosing function specification behaves like an ELLA Macro, and therefore full type checking is not possible at the static semantic stage. For that reason the following function is necessary for the type checking of a Biop specification.

Biop-Type-Equals : $kType \times kType \rightarrow \mathbb{B}$

```

Biop-Type-Equals( $bty_1, bty_2$ )  $\triangleq$ 
  cases (Get-Type( $bty_1$ ), Get-Type( $bty_2$ )) of
    ( typeno( $typeno$ ), typeno( $\cdot$ ))  $\rightarrow$  true
    ( stringtype( $s_1, tn_1$ ), stringtype( $s_2, tn_2$ ))  $\rightarrow$  Biop-Type-Equals( $tn_1, tn_2$ )
    ( types([ $t_1, \dots, t_k$ ]), types([ $s_1, \dots, s_j$ ]))  $\rightarrow$   $j = k \bigwedge_{i=1..k} Biop-Type-Equals(t_i, s_i)$ 
    ( typevoid, typevoid)  $\rightarrow$  true
    others false
  end

```

4.8 Type Indexing

These function describes how to obtain the type of an indexed or trimmed quantity

Get-Index : $kType \times \mathbb{N}_1 \rightarrow kType$

```

Get-Index( $ty, i$ )  $\triangleq$ 
  cases Get-Type( $ty$ ) of
    types([ $ktype_1, \dots, ktype_k$ ])  $\rightarrow$   $ktype_i$ ,
    stringtype( $\cdot, ktype$ )  $\rightarrow$   $ktype$ 
  end

```

Trim : $kType \times N_1 \times N_1 \rightarrow kType$

```

Trim(ty, lb, ub)  $\triangleq$ 
  cases Get-Type(ty) of
    types([ktype1, ..., ktypek])  $\rightarrow$  types([ktypelb, ..., ktypeub]),
    stringtype(., ktype)  $\rightarrow$  stringtype((ub-lb + 1), ktype)
  end

```

4.9 Concatenation

Concatenation of two signal types are handled by means of the following function.

Conc : $kType \times kType \rightarrow kType$

```

Conc(ktype1, ktype2)  $\triangleq$ 
  let ty1 = Get-Type(ktype1) in
  let ty2 = Get-Type(ktype2) in
  cases (ty1, ty2) of
    ( types([ta1, ..., tak]), types([tb1, ..., tbl]))  $\rightarrow$ 
      if ( $\forall i \in \{1..k\}, j \in \{1..l\} \cdot (ta_i = \boxed{T} = tb_j)$ ) = true
        then types([ta1, ..., tak, tb1, ..., tbl])
      else if ( $\forall i \in \{1..k\} \cdot (ta_i = \boxed{T} = ty_2)$ ) = true
        then types([ta1, ..., tak, ty2])
      else if ( $\forall j \in \{1..l\} \cdot ty_1 = \boxed{T} = tb_j$ ) = true
        then types([ty1, tb1, ..., tbl])
      else  $\emptyset$ 
    ( types([t1, ..., tk]), .)  $\rightarrow$  let ( $\forall i \in \{1..k\} \cdot t_i = \boxed{T} = ty_2$ ) = true in
      types([t1, ..., tk, ty2])
    (., types([t1, ..., tk]))  $\rightarrow$  let ( $\forall i \in \{1..k\} \cdot t_i = \boxed{T} = ty_1$ ) = true in
      types([ty1, t1, ..., tk])
    ( stringtype(sizea, ktypea), stringtype(sizeb, ktypeb))  $\rightarrow$  let (ktypea =  $\boxed{T}$  = ktypeb) = true in
      stringtype(sizea + sizeb, ktypea)
    ( stringtype(size, ktype), .)  $\rightarrow$  let (ktype =  $\boxed{T}$  = ty2) = true in
      stringtype(size + 1, ktype)
    (., stringtype(size, ktype))  $\rightarrow$  let (ty1 =  $\boxed{T}$  = ktype) = true in
      stringtype(size + 1, ktype)
  end

```

4.10 Reform

This function flattens types so that they are available for `reform`

Flatten : $kType \rightarrow kTypeSeq$

```

Flatten(ty)  $\triangleq$ 
  cases Get-Type(ty) of
    typeno (typeno)  $\rightarrow$  [ typeno(typeno) ],
    stringtype (size, ktype)  $\rightarrow$  [ stringtype(size, ktype) ],
    types ([t1, ..., tk])  $\rightarrow$  Flatten(t1)  $\cap$  ...  $\cap$  Flatten(tk)
    typevoid  $\rightarrow$  [ typevoid ]
  end

```

4.11 Character Check

This rule checks that a particular type is of the form of an ELLA character.

Is-Char : $N_1 \rightarrow B$

Is-Char(*typeno*) \triangleq (Env.*typedec*)[*typeno*].*new* \in **chars**

4.12 Constructing Tuples

These functions convert sequences into tuples.

Type Tuple : $kTypeSeq \rightarrow kType$

```

Type Tuple(tseq)  $\triangleq$  if len tseq = 1
  then tseq[1]
  else types (tseq)

```

Const Tuple : $kConstSeq \rightarrow kConst$

```

Const Tuple(cseq)  $\triangleq$  if len cseq = 1
  then cseq[1]
  else consts (cseq)

```

Constset Tuple : $kConstsetSeq \rightarrow kConstset$

```

Constset Tuple(csseq)  $\triangleq$  if len csseq = 1
  then csseq[1]
  else constsets (csseq)

```

Unit Tuple : $kUnitSeq \rightarrow kUnit$

```

Unit Tuple(useq)  $\triangleq$  if len useq = 1
  then useq[1]
  else units (useq)

```

4.13 Case Disjointness

The following function checks that a CASE statement has disjoint choosers

```

Disjoint : kConstset × kConstset → B
Disjoint(cset1, cset2) △
  cases (cset1, cset2) of
    ( enum(., tagno1), enum(., tagno2)) → tagno1 ≠ tagno2
    ( string(., [tagno11, ..., tagno1k]), string(., [tagno21, ..., tagno2k])) → ∨i=1..k (tagno1i ≠ tagno2i)
    ( constsetassoc( enum(., tagno1), constset1),
      constsetassoc( enum(., tagno2), constset2)) → tagno1 ≠ tagno2 ∨
      Disjoint(constset1, constset2)
    ( constsets([csa1, ..., csak]),
      constsets([csb1, ..., csbk])) → ∨i=1..k Disjoint(csai, csbi)
    ( _, constsetalts([csa1, ..., csak])) → ∏i=1..k Disjoint(cset1, csai)
    ( constsetalts([csa1, ..., csak]), _) → ∏i=1..k Disjoint(csai, cset2)
    ( constsetstring(sizea, cseta),
      constsetstring(sizeb, csetb)) → (sizea ≠ sizeb) ∨
      Disjoint(cseta, csetb)
    ( constsetstring(sizea, cseta),
      string(ty, [tg1, ..., tgk])) → (sizea ≠ k) ∨
      ∨i=1..k Disjoint(cseta, enum(ty, tgi))
    ( string(., .), constsetstring(., .)) → Disjoint(cset2, cset1)
    ( constsetany(type), _)
    ( _, constsetany(type)) → false
  end

```

4.14 Local Type Checking

```

Not-Local-Type : kType → B
Not-Local-Type(ktype) △
  cases Get-Type(ktype) of
    typeno(typeno) → ∀(i ∈ rng Env.lcltypnamemap) · i ≠ typeno(typeno)
    types([t1, ..., tn]) → ∏i ∈ {1..n} Not-Local-Type(ti)
    stringtype(size, t) → Not-Local-Type(t)
    others true
  end

```

This function checks that its input type is not a locally declared type, and will be used by local BEGIN..END clauses to ensure that the output from the clause only contains global types.

5 Transformational Rules

This section describes the transformational rules from Core ELLA to the Kernel. These include the semantic checks which are done by the full ELLA compiler on Core ELLA ie. type checking, name checking etc. Thus this section includes a description of the static semantics of Core ELLA. At the start of each subsection the Core ELLA syntax, for which the transformations of that section apply, will be given. In each rule the order of execution of the pre-conditions is left-to-right, top-to-bottom.

5.1 Enumerated Values

Enumerated values are defined by

```
enumerated ::= altname
             | tagname / z
             | tagname 'char'
             | tagname "string"
```

and the transformations on them are given by

$$\boxed{\text{EM1}} \quad \begin{array}{l} \text{Find-ELLAint (tagname)} = k\text{typeno}, lb, ub \quad lb \leq z \leq ul \\ [\text{tagname}/z] = \boxed{\text{EM}} \Rightarrow \text{enum}(k\text{typeno}, z-lb+1) : \text{typeno}(k\text{typeno}) \end{array}$$

$$\boxed{\text{EM2}} \quad \begin{array}{l} \text{Find-Char (tagname, char)} = \text{enum}(k\text{typeno}, \text{index}) \\ [\text{tagname}'\text{char}] = \boxed{\text{EM}} \Rightarrow \text{enum}(k\text{typeno}, \text{index}) : \text{typeno}(k\text{typeno}) \end{array}$$

$$\boxed{\text{EM3}} \quad \begin{array}{l} \forall i \in \{1..k\} \cdot (\text{Find-Char (tagname, char}_i) = \text{enum}(k\text{typeno}, k\text{tagno}_i)) \\ [\text{tagname}"\text{char}_1 \dots \text{char}_k"] = \boxed{\text{EM}} \Rightarrow \\ \text{string}(k\text{typeno}, [k\text{tagno}_1, \dots, k\text{tagno}_k]) : \text{stringtype}(k, \text{typeno}(k\text{typeno})) \end{array}$$

5.2 Types

Types in Core ELLA can have the following form

```
type ::= typename
        | STRING [ size ] typename
        | [ size ] type
        | ( type1, ..., typek )
        | ()
```

and the transformations that apply to them are

T1 *Find-Type (typename) = ktype*

$$[\text{typename}] = \boxed{T} \Rightarrow \text{ktype}$$

T2 *[typename] = $\boxed{T} \Rightarrow \text{ktype}$ Get-Type(ktype) = typeno(ktypeno) Is-Char (ktypeno)*

$$[\text{STRING[size]} \text{typename}] = \boxed{T} \Rightarrow \text{stringtype(size, ktype)}$$

T3 *[type] = $\boxed{T} \Rightarrow \text{ktype}$*

$$[\text{[size]} \text{type}] = \boxed{T} \Rightarrow \text{types}([\text{ktype}^{\text{size}}])$$

T4 *$\forall i \in \{1..k\} \cdot ([type_i] = \boxed{T} \Rightarrow t_i)$*

$$[(type_1, \dots, type_k)] = \boxed{T} \Rightarrow \text{Type Tuple}([t_1, \dots, t_k])$$

T5 *[()] = $\boxed{T} \Rightarrow \text{typevoid}$*

5.3 Constants

The Core ELLA definition of constants is

```
const      ::=  STRING [ size ] const1
              | [ size ] const
              | const1
```

```
const1     ::=  enumerated
              | altname & const1
              | ( const1, ..., const_k )
              | ? type
              | ()
```

with their transformation rules being

C1 *[const1] = $\boxed{C} \Rightarrow \text{kconst: ktype}$*

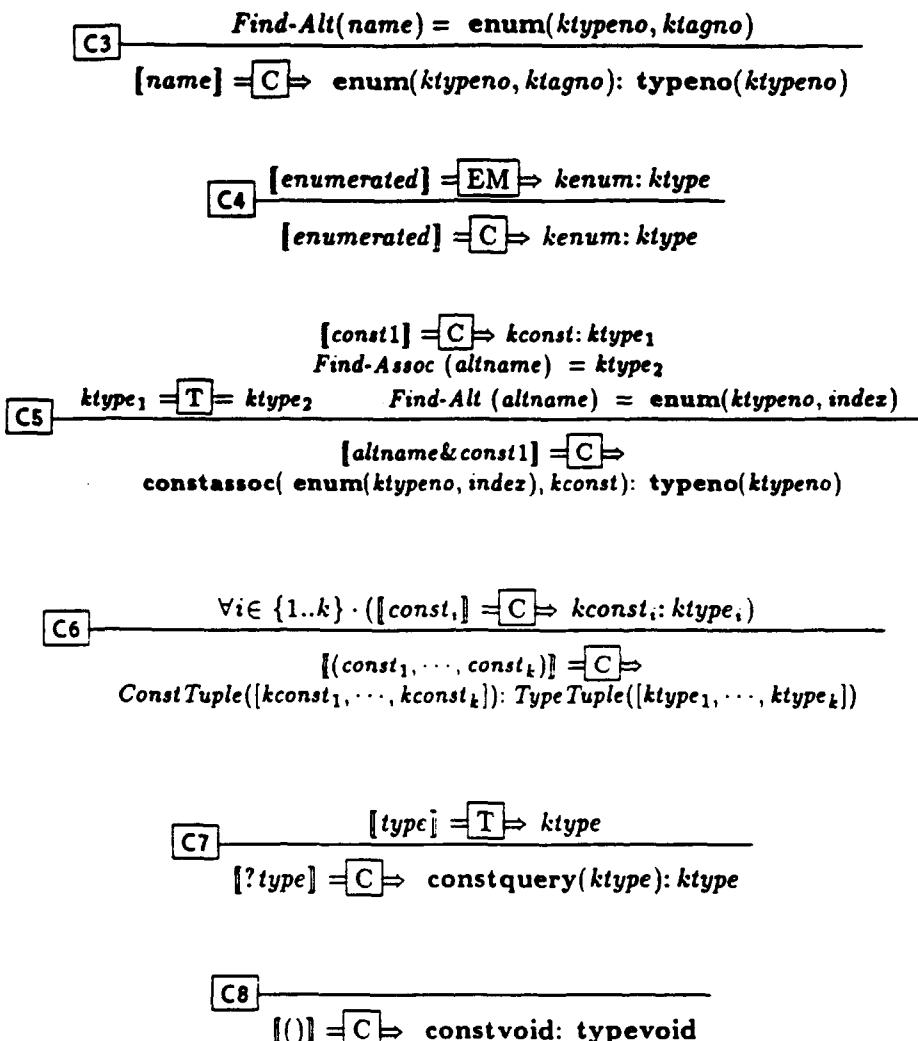

Get-Type(ktype) = typeno(ktypeno)

Is-Char (ktypeno)

[stringtype(size, typeno(ktypeno))]

C2 *[const] = $\boxed{C} \Rightarrow \text{kconst: ktype}$*

[[size]const] = $\boxed{C} \Rightarrow \text{consts}([\text{kconst}^{\text{size}}]): \text{types}([\text{ktype}^{\text{size}}])$

5.4 Constant Sets

Constant sets are given by

```

constset ::= constset1 | ... | constsetk

constset1 ::= STRING [ size ] constset2
               | [ size ] constset1
               | constset2

constset2 ::= enumerated
               | altname & constset2
               | ( constset1, ..., constsetk )
               | type
  
```

with transformations on them given by

$\boxed{CS1}$	$\forall i \in \{1..k\} \cdot ([constset_i] = \boxed{CS} \Rightarrow kcset_i : ktype_i)$ $\forall i \in \{1..k\} \cdot (ktype_i = \boxed{T} = ktype_1)$ $[constset_1 \dots constset_k] = \boxed{CS} \Rightarrow \text{constsetalts}([kcset_1, \dots, kcset_k]): ktype_1$
$\boxed{CS2}$	$[constset2] = \boxed{CS} \Rightarrow kcset : ktype$ $\text{Get-Type}(ktype) = \text{typeno}(ktypeno)$ $\text{Is-Char}(ktypeno)$ $[STRING[size]constset2] = \boxed{CS} \Rightarrow \text{constsetstring}(size, kcset) : \text{stringtype}(size, \text{typeno}(ktypeno))$
$\boxed{CS3}$	$[constset1] = \boxed{CS} \Rightarrow kcset : ktype$ $[[size]constset1] = \boxed{CS} \Rightarrow \text{constsets}([kcset^{size}]) : \text{types}([ktype^{size}])$
$\boxed{CS4}$	$\text{Find-Type-or-Alt}(name) = res$ $[name] = \boxed{CS} \Rightarrow$ $\text{if } res = \text{enum}(ktypeno, \dots) \text{ then } res : \text{typeno}(ktypeno) \text{ else } \text{constsetany}(res) : res$
$\boxed{CS5}$	$[enumerated] = \boxed{EM} \Rightarrow kenum : ktype$ $[enumerated] = \boxed{CS} \Rightarrow kenum : ktype$
$\boxed{CS6}$	$[constset2] = \boxed{CS} \Rightarrow kcset : ktype_1 \quad \text{Find-Assoc}(altname) = ktype_2$ $ktype_1 = \boxed{T} = ktype_2 \quad \text{Find-Alt}(altname) = \text{enum}(ktypeno, tagno)$ $[altname & constset2] = \boxed{CS} \Rightarrow \text{constsetassoc}(\text{enum}(ktypeno, tagno), kcset) : \text{typeno}(ktypeno)$
$\boxed{CS7}$	$\forall i \in \{1..k\} \cdot ([constset_i] = \boxed{CS} \Rightarrow kcset_i : ktype_i)$ $((constset_1, \dots, constset_k)) = \boxed{CS} \Rightarrow \text{ConstsetTuple}([kcset_1, \dots, kcset_k]) : \text{Type Tuple}([ktype_1, \dots, ktype_k])$

5.5 Units

The complete Core ELLA unit syntax is given by

```
unit      ::=      unit CONC unit1
                  | unit1
```

```

unit1 ::= STRING [ size ] unit1
| { size } unit1
| fnname unit1
| altname & unit1
| unit2 // altname
| unit2

```

```

unit2 ::= signalname
| enumerated
| unit2 [ index ]
| unit2 [ indexlow .. indexup ]
| unit2 [ [ unit ] ]
| REPLACE (unit, unit, unit)
| ? type
| closedclause

```

with the transformations defined by

- U1 $\boxed{\text{Find-Sig-or-Alt(name)}} = \text{res}$
- $[\text{name}] = \boxed{U} \Rightarrow$
if $\text{res} = \text{enum}(ktypeno, .)$ then $\text{res} : \text{typeno}(ktypeno)$ else res
-
- U2 $[\text{enumerated}] = \boxed{EM} \Rightarrow \text{kenum}: ktypeno$
- $[\text{enumerated}] = \boxed{U} \Rightarrow \text{kenum}: ktypeno$
-
- U3 $[\text{unit CONC unit1}] = \boxed{U} \Rightarrow \text{conc}(\text{kunit}_1, \text{kunit}_2, \text{ktype}_{\text{out}}): \text{ktype}_{\text{out}}$
- $[\text{unit1}] = \boxed{U} \Rightarrow \text{kunit}: \text{ktype}$
 $\text{Get-Type}(\text{ktype}) = \text{typeno}(ktypeno)$
 $\text{Is-Char}(\text{ktypeno})$
-
- U4 $[\text{STRING[size]unit1}] = \boxed{U} \Rightarrow$
 $\text{unitstring}(\text{size}, \text{kunit}): \text{stringtype}(\text{size}, \text{typeno}(ktypeno))$
-
- U5 $[\text{unit1}] = \boxed{U} \Rightarrow \text{kunit}: \text{ktype}$
- $[(\text{size})\text{unit1}] = \boxed{U} \Rightarrow \text{units}((\text{kunit}^{\text{size}})): \text{types}([\text{ktype}^{\text{size}}])$
-
- U6 $[\text{fnname unit1}] = \boxed{U} \Rightarrow \text{kunit}: \text{ktype}$
 $\text{fnno} = \text{Find-Fn}(\text{fnname})$
 $(\text{Env.fndec})[\text{fnno}].\text{inputtype} = \boxed{T} = \text{ktype}$
- $[\text{fnname unit1}] = \boxed{U} \Rightarrow \text{instance}(\text{fnno}, \text{kunit}): ((\text{Env.fndec})[\text{fnno}].\text{outputtype})$

U7 $\boxed{[unit1] = U \Rightarrow kunit_1: ktype_1}$
 $\boxed{Find\text{-}Assoc(altname) = ktype_2}$
 $ktype_1 = T = ktype_2 \quad Find\text{-}Alt(altname) = enum(ktypeno, tagno)$

$[altname\&unit1] = U \Rightarrow$
 $unitassoc(enum(ktypeno, tagno), kunit_1): typeno(ktypeno)$

U8 $\boxed{[unit2] = U \Rightarrow kunit: ktype}$
 $\boxed{Find\text{-}Assoc(altname) = ktypeout,}$
 $\boxed{Find\text{-}Alt(altname) = enum(typeno, index),}$
 $\boxed{typeno(typeno) = T = ktype}$

$[unit2//altname] = U \Rightarrow extract(kunit, enum(typeno, index)): ktypeout$

U9 $\boxed{[unit2] = U \Rightarrow kunit: ktype}$
 $\boxed{Get\text{-}Index(ktype, index) = t}$

$[unit2[index]] = U \Rightarrow index(kunit, index, t): t$

U10 $\boxed{[unit2] = U \Rightarrow kunit: ktype}$
 $\boxed{Trim(ktype, index_{lb}, index_{ub}) = t}$

$[unit2[index_{lb}..index_{ub}]] = U \Rightarrow trim(kunit, index_{lb}, index_{ub}, t): t$

U11 $\boxed{[unit2] = U \Rightarrow kunit_1: ktype_1}$
 $\boxed{[unit] = U \Rightarrow kunit_2: ktype_2}$
 $\boxed{Find\text{-}Integer\text{-}Type(ktype_2) = ktypeno, l, u}$
 $\boxed{Find\text{-}Row(ktype_1) = size, tt \quad 1 \leq l \leq u \leq size}$

$[unit2[[unit]]] = U \Rightarrow dyindex(kunit_1, kunit_2, tt): tt$

U12 $\boxed{[unit_1] = U \Rightarrow kunit_1: ktype_1}$
 $\boxed{[unit_2] = U \Rightarrow kunit_2: ktype_2}$
 $\boxed{[unit_3] = U \Rightarrow kunit_3: ktype_3}$
 $\boxed{Find\text{-}Integer\text{-}Type(ktype_2) = ktypeno, l, u}$
 $\boxed{Find\text{-}Row(ktype_1) = size, t}$
 $1 \leq l \leq u \leq size \quad ktype_3 = T = t$

$[REPLACE(unit_1, unit_2, unit_3)] = U \Rightarrow replace(kunit_1, kunit_2, kunit_3): ktype_1$

$\boxed{?type} = U \Rightarrow unitquery(ktype): ktype$

U14 $\boxed{[closedclause] = CC \Rightarrow kunit: ktype}$

$\boxed{[closedclause] = U \Rightarrow kunit: ktype}$

5.6 Closedclause

Closed clauses are given by

```

closedclause ::= CASE unit OF cases ELSE unit ESAC
| ( unit1, ..., unitk )
| BEGIN step1 ... stepk-1 OUTPUT unit END
| ()

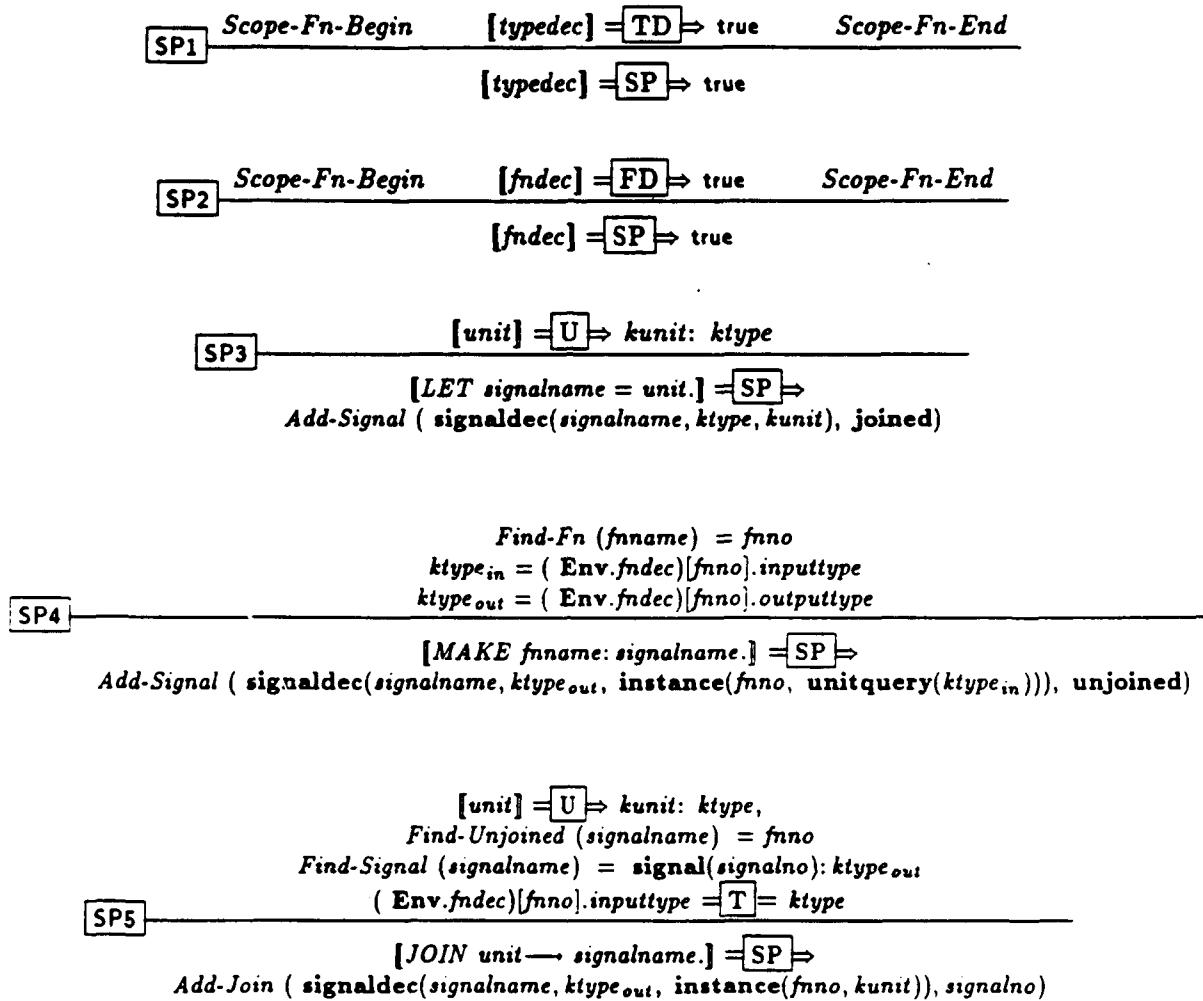

cases ::= constset1 : unit1, ..., constsetk : unitk

step ::= typedec
| fndec
| LET signalname = unit .
| MAKE fname : signalname .
| JOIN unit → signalname .

```

with the transformations given by

$$\begin{array}{c}
\boxed{\text{CA}} \xrightarrow{\quad} \boxed{\text{CS}} \Rightarrow k\text{constset}: k\text{typeconst} \\

\end{array}$$

5.7 Built-In Functions

Built-in-functions (function bodies) are defined to be

```
functionbody ::= unit
| REFORM
| BIOP biopname
| DELAY ( initialvalue, ambigtime, ambigvalue, delaytime )
| IDELAY ( initialvalue, delaytime )
| SAMPLE ( interval, initialvalue, skewtime )
| RAM ( initialvalue )
```

with the following transformations

BI1 $Type Tuple(Flatten(ktype_{in})) = T = Type Tuple(Flatten(ktype_{out}))$

$[REFORM] \{ktype_{in}, ktype_{out}\} = BI \Rightarrow reform$

B12 $\text{Find-Biop}(\text{biopname}, \text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}) = \text{biop}(\text{biopname})$
 $[\text{BIOP biopname}] \{\text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}\} = \boxed{\text{BI}} \Rightarrow \text{biop}(\text{biopname})$

$[\text{initialvalue}] = \boxed{C} \Rightarrow \text{kconst}_i : \text{ktype}_i$
 $[\text{ambigvalue}] = \boxed{C} \Rightarrow \text{kconst}_a : \text{ktype}_a$
 $\text{ktype}_{\text{in}} = \boxed{T} = \text{ktype}_{\text{out}} = \boxed{T} = \text{ktype}_i = \boxed{T} = \text{ktype}_a$
 $0 \leq \text{ambigtime} \leq \text{delaytime}$ $0 < \text{delaytime}$

B13 $[\text{DELAY(initialvalue, ambigtime, ambigvalue, delaytime)}] \{\text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}\} = \boxed{\text{BI}} \Rightarrow$
 $\text{delay}(\text{kconst}_i, \text{ambigtime}, \text{kconst}_a, \text{delaytime})$

B14 $[\text{initialvalue}] = \boxed{C} \Rightarrow \text{kconst} : \text{ktype}$ $\text{ktype} = \boxed{T} = \text{ktype}_{\text{in}} = \boxed{T} = \text{ktype}_{\text{out}}$
 $[\text{IDELAY(initialvalue, delaytime)}] \{\text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}\} = \boxed{\text{BI}} \Rightarrow$
 $\text{idelay}(\text{kconst}, \text{delaytime})$

B15 $[\text{initialvalue}] = \boxed{C} \Rightarrow \text{kconst} : \text{ktype}$
 $-\text{interval} \leq \text{skew} \leq \text{interval}$ $\text{ktype}_{\text{in}} = \boxed{T} = \text{ktype}_{\text{out}} = \boxed{T} = \text{ktype}$
 $[\text{SAMPLE(interval, initialvalue, skew)}] \{\text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}\} = \boxed{\text{BI}} \Rightarrow$
 $\text{sample}(\text{interval}, \text{kconst}, \text{skew})$

B16 $[\text{initialvalue}] = \boxed{C} \Rightarrow \text{kconst}_I : \text{ktype}_I$
 $\text{ktype}_{\text{in}} = \text{types}([\text{ktype}_{\text{data}}, \text{ktype}_{\text{writeaddress}}, \text{ktype}_{\text{readaddress}}, \text{ktype}_{\text{writeenable}}])$
 $\text{ktype}_{\text{data}} = \boxed{T} = \text{ktype}_{\text{out}} = \boxed{T} = \text{ktype}_I$
 $\text{Find-Integer-Type}(\text{ktype}_{\text{writeaddress}}) = -, \text{lb}, \text{ub}$
 $\text{Find-Integer-Type}(\text{ktype}_{\text{readaddress}}) = -, \text{lb}, \text{ub}$ $\text{lb} = 1$
 $\text{Check-Two-Val}(\text{Get-Type}(\text{ktype}_{\text{writeenable}}))$
 $[\text{RAM(initialvalue)}] \{\text{ktype}_{\text{in}}, \text{ktype}_{\text{out}}\} = \boxed{\text{BI}} \Rightarrow \text{ram}(\text{kconst}_I)$

5.8 Type Declarations

Type declarations are defined as

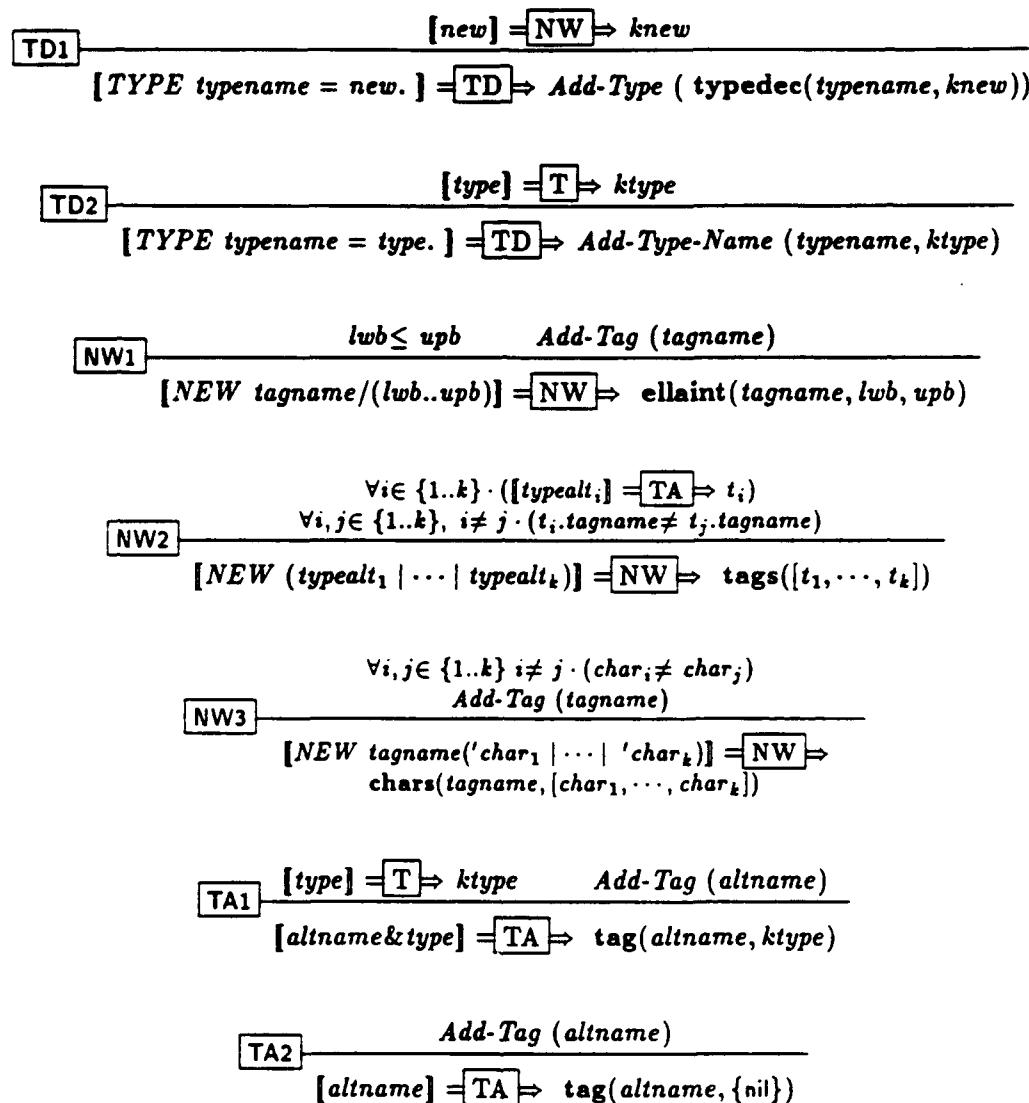

typedec ::= **TYPE** **typename** = **typeornew**.

typeornew ::= **type**
| **new**

new ::= **NEW** **tagname** / (**lwb** .. **upb**)
| **NEW** (**typealt**₁ | ... | **typealt**_k)
| **NEW** **tagname** ('char' ₁ | ... | 'char' _k)

typealt ::= **altname** & **type**
| **altname**

with transformations on them by

5.9 Function Declarations

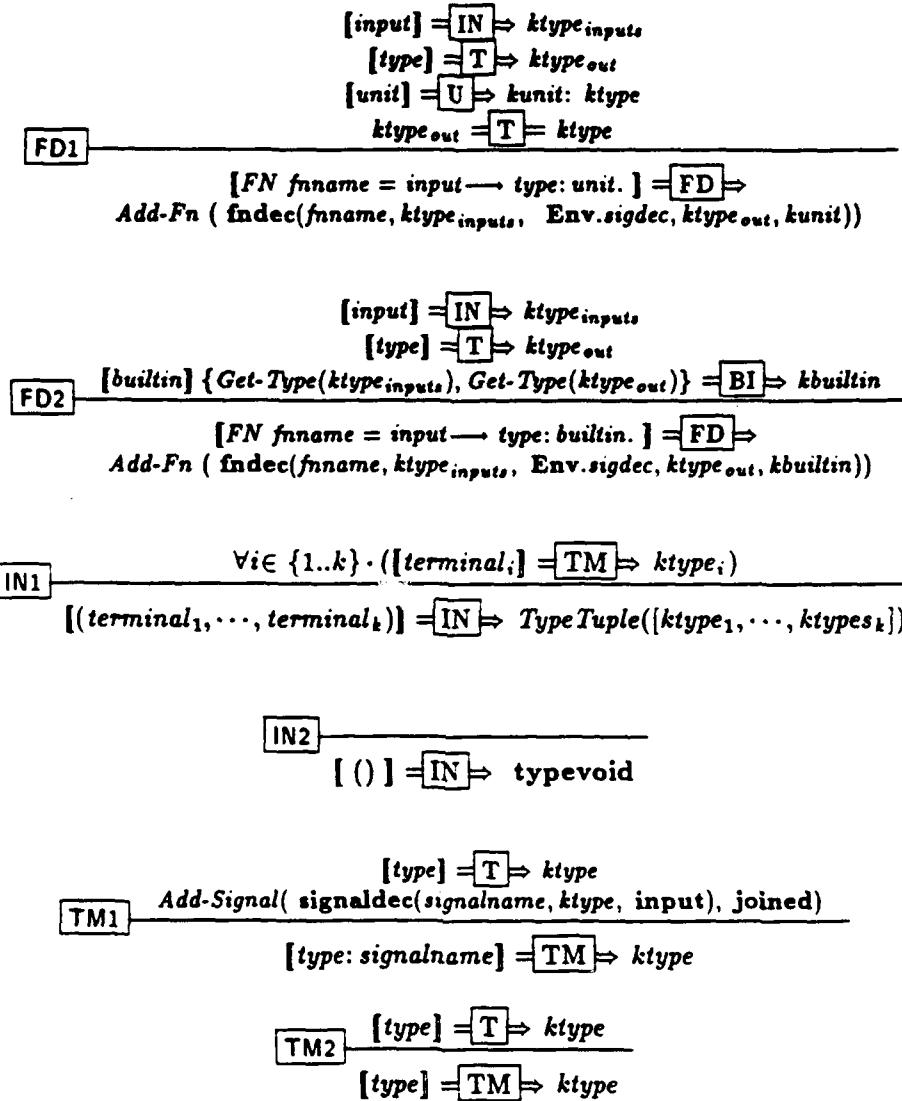

Function declarations are given by

`fndec ::= FN ffname = input → type : functionbody.`

`input ::= (terminal1, ..., terminalk)`
 | ()

`terminal ::= type : signalname`
 | type

and the transformations on them by

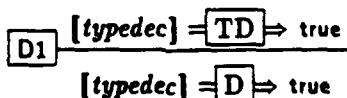

5.10 Closure

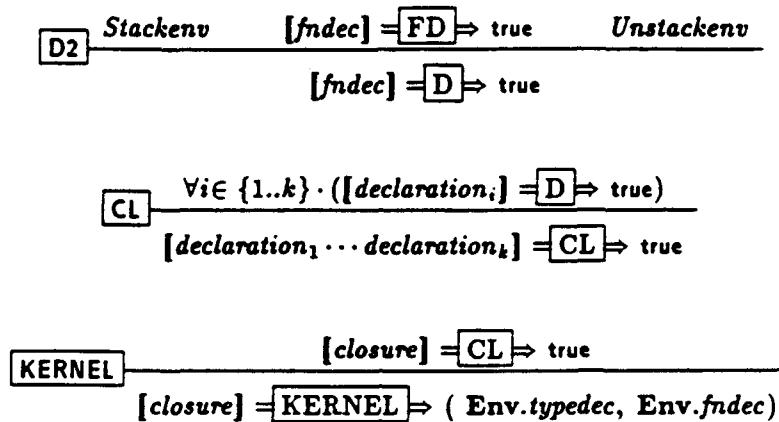

A Closure is defined to be

declaration ::= typedec
| fndec

closure ::= declaration₁ ... declaration_n

with the following transforms

6 Software Implementation

The functions and transformational rules given in the previous sections have been translated into Lisp code. This work forms parts of the commitment to the IED project "Formal Verification Support for ELLA" which is developing a Lisp environment and toolset for Formal Verification. The Lisp system and the Lexical Analyser were made available for the project by Harlequin Ltd. of Cambridge.

The Kernel data structures were translated into Lisp structures, for example `typeno(typeno)` became

```
(defstruct $typeno (typeno))
```

where the \$ is used to prefix all Kernel data structures (corresponding to bold type in Appendix C). Translation of the functions defined in this document to Lisp was straightforward with only a few additional functions needed to handle recursive structures.

7 Transformation Examples

In this section we give examples of Core ELLA descriptions which have been compiled into Kernel data structures by means of the software implementation. The implementation has been carried out using the Harlequin Lisp system (LispWorks), with the resulting code being incorporated into the verification environment of the project.

The first example is taken from [MH91], whilst the second example contains Core ELLA text which will test each transformation rule (although not for every possible combination of constructs).

7.1 Simple Example

This example is taken from [MH91] and is reproduced below

```

TYPE bool = NEW (t | f).

FN NOR = (bool:in1, bool:in2) -> bool:
CASE (in1, in2) OF
  (f,t):f,
  (t,f):f,
  (t,t):f
ELSE t
ESAC.

FN A = (bool:in1, bool:in2) -> bool:
BEGIN
  LET ip = (in1,in2).
  FN B = (bool:ip1, bool:ip2) -> bool: NOR(ip1,ip2).
  MAKE B:b.
  JOIN ip -> b.
  OUTPUT b
END.

```

In [MH91] it was shown how each of the transformation rules was applied to these functions and the final Kernel environment was deduced. By means of the Lisp implementation of the rules, the final Kernel environment was calculated and is shown below, where it has been printed out by means of a specially written Lisp printer.

```

TYPEDECS>
TYPEDEC ("bool" Tags([Tag(t, NIL), Tag(f, NIL)]))
FNDECS>
FNDEC( NOR,
  Types([Typeno(1), Typeno(1)]),
  [Signaldec("in1", Typeno(1), input),
  Signaldec("in2", Typeno(1), input)],
  Typeno(1),
  Caseclause(Units([Signal(1), Signal(2)]),
    [Case(Constsets([Enum(1, 2), Enum(1, 1)]), Enum(1, 2)),
     Case(Constsets([Enum(1, 1), Enum(1, 2)]), Enum(1, 2)),
     Case(Constsets([Enum(1, 1), Enum(1, 1)]), Enum(1, 2))],
    Enum(1, 1)))
FNDEC( B,
  Types([Typeno(1), Typeno(1)]),
  [Signaldec("ip1", Typeno(1), input),
  Signaldec("ip2", Typeno(1), input)],
  Typeno(1),
  Instance(1, Units([Signal(1), Signal(2)])))
FNDEC( A,
  Types([Typeno(1), Typeno(1)]),
  [Signaldec("in1", Typeno(1), input),
  Signaldec("in2", Typeno(1), input),
  Signaldec("ip", Types([Typeno(1), Typeno(1)]), Units([Signal(1), Signal(2)]))),
  Signaldec("b", Typeno(1), Instance(2, Signal(3)))],

```

```

    Typeno(1),
    Signal(4))
SIGDECS>
FNMAPS>
LCLFNMAPS>
map("A", 3)
map("NOR", 1)
TYNAMEMAPS>
LCLTYNAMEMAPS>
map("bool", Typeno(1))
map("f", Consttag(1))
map("t", Consttag(1))
SIGNAMEMAPS>
LCLSIGNAMEMAPS>
USEDTYNAMES>
USEDFNAMES>
USESIGNAMES>

```

This environment is identical to the environment given in [MH91].

Due to the nature of the Kernel data structures it is possible to print out the above environment in a more readable format. This format takes on a layout which is a 'recursive-LET' ELLA-like form e.g.

```

TYPEDEC bool = NEW (t | f)
FNDECS>
FNDEC NOR = ((bool, bool)) -> (bool):
  BEGIN (LET in1 = input. LET in2 = input.)
  OUTPUT CASE (in1,in2) OF
    ( ((f ,t ) : f )
     ((t ,f ) : f )
     ((t ,t ) : f ))
    ELSE t
    ESAC
  END.
FNDEC B = ((bool, bool)) -> (bool):
  BEGIN (LET ip1 = input. LET ip2 = input.)
  OUTPUT NOR (ip1,ip2)
  END.
FNDEC A = ((bool, bool)) -> (bool):
  BEGIN (LET in1 = input.
         LET in2 = input.
         LET ip = (in1,in2).
         LET b = B ip.)
  OUTPUT b
  END.
SIGDECS>
FNMAPS>
LCLFNMAPS>

```

```

map("A" : 3)
map("NOR" : 1)
TYNAMEMAPS>
LCLTYNAMEMAPS>
map("bool" : bool)
map("f" : "bool")
map("t" : "bool")
SIGNAMEMAPS>
LCLSIGNAMEMAPS>
USEDTYNAMES>
USEDFH NAMES>
USEDSIGNAMES>

```

The 'map' fields show which declarations are available for use at the outermost level, hence function 'B' does not appear in either of the function maps.

7.2 Transformational Rules Test

In this section we present a test program which goes through the different transformation rules.

The first part of the test program looks at individual expressions, for example constant expressions are created in a delay expression.

```

FN FBODY_30 = (char:one) -> char: IDELAY( c'd, 3).           #enum#
FN FBODY_31 = (string:one) -> string: IDELAY( c"abcdef", 3).      #string#
FN FBODY_32 = (string:one) -> string: IDELAY( STRING [8] c'c, 3).  #conststring#
FN FBODY_33 = ((enum, int):one) -> (enum, int): IDELAY( (e1,i/1), 3).  #consts#
FN FBODY_34 = (assoc:one) -> assoc: IDELAY( val & i/7, 3).        #constassoc#
FN FBODY_35 = (enum:one) -> enum: IDELAY( ?enum, 3).            #constquery#

```

Scoping rules are considered in the second part of the test program where a number of functions are given for testing the different forms of enumerated values applied to units as well as testing the scoping rules. For example

```

FN NUMBER_4 = (string:one, string: two, [4]string:three, range: four)->string:
BEGIN

END.

```

The complete test program is given in appendix F.

This test program has been successfully submitted to the Lisp implementation of the rules defined in this document. The complete file took 2.6 secs to translate into the Kernel via the implementation on a SparcStation 2 and the final environment contained 72 functions and 30 global identifiers.

7.3 From Full ELLA to the Kernel

In appendix G we present an example taken from a description in High level ELLA using sequences, down to Core ELLA via the full ELLA system and then into the Kernel via the Lisp system. The example is based on a three pump controller, the functionality of which is defined by

A reservoir is connected to a lake by a pipe line. Water is taken from the lake to the reservoir by a system of three pumps. Three level sensors are installed on the reservoir. Their outputs are denoted by signals a_1 , a_2 , a_3 . Signal a_i is 0 when the water is above level i , for $i = 1, 2, 3$ and has a value 1 when the water is below level i . The number of pumps that are on at any one time depends on the water level in the reservoir. In particular: if the water level is between level 1 and 2, then one pump should be in operation; if the water level is between level 2 and 3, then two pumps should be in operation; if the water level is below level 3, then three pumps should be in operation. Of course, if the water level is above level 1 then no pumps should be in operation. In order to equalise wear on the pumps, they should come into operation in a cyclic manner.

Appendix G gives the descriptions for high,medium and Core ELLA as well as the Kernel description which is written out in the recursive-let format.

7.4 Microprocessor Transformations

A number of high level descriptions of microprocessors where submitted to the complete transformation system from Full ELLA to Core ELLA to the Kernel. Table 7.1 shows the resulting

CPU times for the Core-to-Kernel phase together with the number of lines of Kernel code generated. The number of lines of original high level ELLA and the resulting Core ELLA descriptions are given for comparison. The Lisp code which produced these results was compiled and loaded using the Harlequin Lisp system, this gave a very significant improvement in speed for the transformation from Core-to-Kernel over equivalent interpreted code. The translator is implemented on a SparcStation 2.

μ processor	High Level ELLA lines	Core ELLA Lines	Kernel Lines	No. of Functions	No. of ids	Core-to-Kernel Compile Time
68000	298	4280	72000	197	124	93.6 secs
Viper	2434	2625	24000	229	52	25.0 secs
6800	1088	2205	5300	46	212	23.0 secs
6502	991	1623	3900	41	88	16.3 secs

Table 7.1 Microprocessor Translation Times

The number of functions and identifiers correspond to those available in the final Kernel environment. The translation from High level ELLA to Core ELLA was carried out by means of the software transformations in the full ELLA system.

8 Conclusions

In this document the formal definition of the Lisp implementation of the transformational mapping from Core ELLA to the Kernel has been given. Examples of use of the Lisp implementation have been presented.

9 Acknowledgements

The authors would like to acknowledge the support of the IED project 4/1/1357 "Formal Verification Support for ELLA". The authors would also like to thank Harlequin Ltd. of Cambridge for making Lispworks and their Lexical analyser available for this work.

A Glossary of Symbols

Functions

$f: D_1 \times D_2 \rightarrow R$	signature
$f \Delta \dots$	function definition
$f(d)$	application
$\text{if } \dots \text{ then } \dots \text{ else } \dots$	conditional
$\text{let } z = \dots \text{ in } \dots$	local definition
$\text{case } z \text{ of } \dots \text{ else } \dots \text{ end}$	choice
pre	pre-condition

Composite Objects

$\text{Object}::\text{fieldname}:\text{fieldtype}$	Record Object definition
$\mu(E, s \mapsto t)$	change field s of E to hold t
$\mu(E, s \mapsto (E.s \uparrow t))$	update field s of E by overwriting with t

Sets

$T\text{-set}$	finite subset of T
$\{t_1, \dots, t_k\}$	set enumeration
$\{\}$	empty set
$t \in T$	set membership
$T_1 \cap T_2$	set intersection
$T_1 \cup T_2$	set union
$T_1 \subseteq T_2$	set containment
\mathbb{Z}	$\{\dots, -1, 0, 1, \dots\}$
\mathbb{N}_1	$\{1, 2, \dots\}$
\mathbb{B}	{true, false}

Maps

$D \xrightarrow{m} R$	finite map
$\text{dom } m$	domain
$\text{rng } m$	range
$m_1 \uparrow m_2$	overwriting

Sequences

S^*	finite sequence
$[s_1, \dots, s_k]$	sequence enumeration
$[]$	empty sequence
$\text{len } l$	length of sequence l
$s_1 \sim s_2$	concatenation
$i (i \in \text{inds } \text{sequence}) \cdot \text{sequence}[i] = s$	The unique element of sequence which equals s

B Core ELLA Composite Syntax

B.1 Basic Notation

$abc \in \text{Abc}$	'abc' is an element of the set 'Abc'
$b ::= c$	the syntax definition of 'b' is 'c'
	the separator of alternatives in a syntax definition
	ELLA separator of alternatives
$d_1 \dots d_k$	one or more occurrences of 'd'
d_1, \dots, d_k	one or more occurrences of 'd' separated by ','. Note if $k=1$ then no ',' is present.
d_1, \dots, d_{k-1}	zero or more occurrences of 'd' separated by ','. Note if $k=0$ then no ',' is present.
Z	{ ..., -1, 0, 1, ... }
N_1	{ 1, 2, ... }
Identifier	Lower case letter
Fname	Upper case letter or symbol
Constant	ELLA constant expression
Character	Any printable character

B.2 Syntactic Categories

typename	\in	Identifier	(ELLA type name e.g. lower case)
signalname	\in	Identifier	(ELLA signal name)
tagname	\in	Identifier	(ELLA tagged type name)
altname	\in	Identifier	(ELLA enumerated type alternative)
fnname	\in	Fname	(ELLA function name e.g. upper case or symbol)
biopname	\in	Fname	(ELLA BIOP name e.g. upper case)
z	\in	Z	(An integer)
lwb, upb	\in	Z	(An integer)
j,k	\in	N_1	(A non-zero positive integer)
index	\in	N_1	(A non-zero positive integer)
size	\in	N_1	(A non-zero positive integer)
interval	\in	N_1	(ELLA timing interval)
ambigtime	\in	N_1	(Ambiguity delay time)
delaytime	\in	N_1	(delay time)
skewtime	\in	N_1	(skew delay)
initialvalue	\in	Constant	(Delay, Retiming or Ram initialisation value)
ambigvalue	\in	Constant	(Delay ambiguity value)
char	\in	Character	(A printable character e.g. 'a')
string	\in	String	(A string of printable characters e.g. 'abc')

B.3 Syntactic Definitions

Enumerated

```
enumerated ::= altname
             | tagname / z
             | tagname 'char'
             | tagname "string"

E Environments

This appendix describes the transformational environment and the environment which holds the necessary information about all the Built in Operators.

E.1 Transformation Environment

The environment (*Env*) is defined to be a record object with 9 fields which will accumulate type, function and signal declarations and maintain information about the scopes of identifiers.

```
Env ::      typedec : kTypedec*  
              fndec : kFndec*  
              sigdec : kSignaldec*  
              fnmap : Fname  $\xrightarrow{m}$  Fnno  
              lclfmap : Fname  $\xrightarrow{m}$  Fnno  
              tynamemap : Name  $\xrightarrow{m}$  TypeTag  
              lclynamemap : Name  $\xrightarrow{m}$  TypeTag  
              signamemap : Signalname  $\xrightarrow{m}$  Sig  
              lcslsignamemap : Signalname  $\xrightarrow{m}$  Sig  
              usedtynname : Name-set  
              usedfnname : Fname-set  
              usedsigname : Signalname-set
```

$$\begin{aligned} \text{inv}(\text{Env}) &\triangleq \\ &(\text{dom}(\text{Env.lcynamemap}) \cap \text{dom}(\text{Env.lcslsignamemap}) \cap \text{dom}(\text{Env.signamemap})) \\ &\wedge \text{dom}(\text{Env.lclfmap}) \end{aligned}$$

with the following being local to the translation process

<i>TypeTag</i>	=	<i>typeno</i> (<i>Typeno</i>)	(new TYPE)
		\cup <i>typename</i> (<i>Typename</i> \times <i>kType</i>)	(TYPE alias)
		\cup <i>consttag</i> (<i>Typeno</i>)	(TYPE tagname alternative)
<i>Sig</i>	=	<i>sig</i> (<i>Signalno</i> \times <i>Sort</i>)	(Signal name)
<i>Sort</i>	=	<i>joined</i> <i>unjoined</i>	(status of signal input field)

The invariant of the environment is defined to be *inv(Env)* which states that all signal and type names must be unique and all function names must be unique.

Note that the first three fields of *Env* are sequences. The use of each field can be summarised as follows

<i>Env.typedec</i>	Accumulates all typedecs for the final closure,
<i>Env.fndec</i>	Accumulates all fndecs for the final closure,
<i>Env.sigdec</i>	Accumulates signaldecs for each fndec,
<i>Env.fnmap</i>	Fn name map - visible outside the most local scope,
<i>Env.lclfmap</i>	Fn name map - in most local BEGIN..END scope,
<i>Env.tynamemap</i>	Type information map - visible outside the most local scope,
<i>Env.lctynamemap</i>	Type information map - in most local BEGIN..END scope,
<i>Env.signamemap</i>	Signal name map - visible outside the most local scope,
<i>Env.lclsignamemap</i>	Signal name map - in the most local BEGIN..END scope,
<i>Env.usedtynname</i>	Type name used and not available for redeclaration,
<i>Env.usedfnname</i>	Function name used and not available for redeclaration,
<i>Env.usedsigname</i>	Signal name used and not available for redeclaration,

Note *fnname*'s are generated by FN declarations, *tynname*'s are generated by TYPE declarations (both the TYPE name and their tags), and *signame*'s are generated by MAKE, LET and input parameter declarations. The used fields hold the names of those identifiers which are exterior to the local scope and which have been used but not redefined within the local scope.

E.2 Built-In Operator Environment

The environment for the Built-In Operators (*BiopEnv*) is a sequence of objects which hold the BIOP name and its typing information

```

BiopEnv :: biop : kBiop*

Biop :: biopname : Fname
          inputtype : kType
          outputtype : kType

```

Due to the Macro nature of BIOPs the full type information cannot be held, thus only the basic information as to whether a BIOP expects an enumerated or a string type input is held in this environment. The full type checking of a BIOP specification occurs at the dynamic semantic stage, see [Hil92].

The library of BIOPs supported by the transformation are listed below. where *type* represents a basic enumerated type, *ttype* a two valued enumerated type and *string* represents a string type, *flag* is a two valued enumerated type used for indicating the success or failure of an operation. For further information on the BIOPs the reader is referred to the ELLA Language Reference Manual [Com90].

AND	: (<i>ttype</i> , <i>ttype</i>) → <i>ttype</i>
AND	: (<i>string</i> , <i>string</i>) → <i>string</i>
OR	: (<i>ttype</i> , <i>ttype</i>) → <i>ttype</i>
OR	: (<i>string</i> , <i>string</i>) → <i>string</i>
XOR	: (<i>ttype</i> , <i>ttype</i>) → <i>ttype</i>
XOR	: (<i>string</i> , <i>string</i>) → <i>string</i>
NOT	: <i>ttype</i> → <i>ttype</i>
NOT	: <i>string</i> → <i>string</i>
EQ	: (<i>type</i> , <i>type</i>) → <i>ttype</i>
GT	: (<i>type</i> , <i>type</i>) → <i>ttype</i>
GE	: (<i>type</i> , <i>type</i>) → <i>ttype</i>
LT	: (<i>type</i> , <i>type</i>) → <i>ttype</i>

G Three Pump Controller

G.1 Introduction

This appendix presents a high level, medium level, Core and Kernel description of a three pump controller. The definition of the controller is given by:

A reservoir is connected to a lake by a pipe line. Water is taken from the lake to the reservoir by a system of three pumps.

Three level sensors are installed on the reservoir. Their outputs are denoted by signals a_1 , a_2 , a_3 . Signal a_i is 0 when the water is above level i , for $i = 1, 2, 3$ and has a value 1 when the water is below level i . The number of pumps that are on at any one time depends on the water level in the reservoir. In particular: if the water level is between level 1 and 2, then one pump should be in operation; if the water level is between level 2 and 3, then two pumps should be in operation; if the water level is below level 3, then three pumps should be in operation. Of course, if the water level is above level 1 then no pumps should be in operation. In order to equalise wear on the pumps, they should come into operation in a cyclic manner.

G.2 High Level Description

In this section we give a high level description of the pump controller.

```

TYPE pump = NEW (none | a | b | ab | c | ca | bc | abc ),
level = NEW 1/(0..3),
bool = NEW (t | f).

FW CONTROL = (level:in) -> pump:
( SEQ
  PVAR store ::= (none,t);
  store := CASE in OF
    1/0 : (store[1],t),
    1/1 : CASE store[1] OF
      a | ca : (b,f),
      b | ab : (c,f)
      ELSE      (a,f)
    ESAC,
    1/2 : CASE store[1] OF
      a | ab : (bc,f),
      b | bc : (ca,f)
      ELSE      (ab,f)
    ESAC,
    1/3 : (abc,f)
  ESAC;
  OUTPUT CASE store[2] OF
    t: none,
    f: store[1]
  ESAC
).

```

Three enumerated types have been defined. The first 'pump' denotes which pumps are actually operating, the pumps being known as 'a', 'b' and 'c'. At first glance the ordering of the enumerated type might appear strange. However the ordering was chosen such that when the circuit is transformed to gate level the output of the controller will be a three bit signal, with each bit representing one of the pumps. The second type 'level' denotes the level of water in the reservoir, with zero representing a full reservoir. The third type is a boolean flag which is used in the monitoring of the active pump. The function CONTROL is the pump controller and its CASE clause sets up which pumps get switched on.

Although CONTROL has been written using sequences this is not really necessary. A functional version of CONTROL is therefore given. this being an equivalent description to the sequential form.

```

 $\text{F1\_DELAY} = ((\text{pump}, \text{bool})) \rightarrow (\text{pump}, \text{bool}): \text{DELAY}((\text{none}, t), 1).$ 

 $\text{F1\_CONTROL} = (\text{level: in}) \rightarrow \text{pump}:$ 
 $\text{BEGIN}$ 
     $\text{MAKE F1\_DELAY: s3store.}$ 
     $\text{LET store =}$ 
         $\text{CASE in OF}$ 
         $1/0: (\text{s3store}[1], t),$ 
         $1/1:$ 
             $\text{CASE s3store[1] OF}$ 
             $a \mid ca: (b, f),$ 
             $b \mid ab: (c, f)$ 
             $\text{ELSE (a, f)}$ 
             $\text{ESAC,}$ 
         $1/2:$ 
             $\text{CASE s3store[1] OF}$ 
             $a \mid ab: (bc, f),$ 
             $b \mid bc: (ca, f)$ 
             $\text{ELSE (ab, f)}$ 
             $\text{ESAC,}$ 
         $1/3: (\text{abc}, f)$ 
         $\text{ESAC.}$ 
     $\text{JOIN store} \rightarrow \text{s3store.}$ 
     $\text{OUTPUT}$ 
         $\text{CASE store[2] OF}$ 
         $t: \text{none.}$ 
         $f: \text{store[1]}$ 
         $\text{ESAC}$ 
 $\text{END.}$ 

```

G.3 Medium Level Description

This section presents the results of replacing the enumerated types for the pump switch's and level indicators by rows of two valued types. This synthesising of the types makes explicit the algorithm behind the type naming of the high level version. It would have been possible to describe the controller from the medium level from the outset, however the higher level version provides extra checks. In particular in the high level version the level indicators can only take

four possible values whereas in this medium level version they can take eight. This medium level version treats such illegal values as 'unknown' and causes the simulator to return the ELLA unknown value, whereas the high level version would explicitly indicate if the level integer range was violated.

This medium level version has maintained close correspondence with the high level version by the use of 'constant' statements. Thus the majority of the controller description has remained unaltered, hence reducing the likelihood of error. The complete description is given by

```

TYPE switch = NEW (on | off),
pump   = [3]switch,
level  = [3]switch,
bool   = NEW (t | f).

CONST none = (off, off, off),
a      = (on, off, off),
b      = (off, on, off),
c      = (off, off, on),
ab     = (on, on, off),
ca     = (on, off, on),
bc     = (off, on, on),
abc    = (on, on, on).

CONST level0 = (off, off, off),
level1 = (on, off, off),
level2 = (on, on, off),
level3 = (on, on, on).

FN CONTROL = (level:in) -> pump:
( SEQ
  PVAR store ::= (none,t);
  store := CASE in OF
    level0 : (store[1],t),
    level1 : CASE store[1] OF
      a | ca : (b,f),
      b | ab : (c,f)
      ELSE    (a,f)
    ESAC,
    level2 : CASE store[1] OF
      a | ab : (bc,f),
      b | bc : (ca,f)
      ELSE    (ab,f)
    ESAC,
    level3 : (abc,f)
  ESAC;
  OUTPUT CASE store[2] OF
    t: none,
    f: store[1]
  ESAC
).

```

G.4 Core Description

This section presents the results of synthesising the medium level description of the pump controller through the ELLA-GATEMAP [Pit88] system. Apart from the functions F1_DELAY and CONTROL all the other functions are basic cells in one of the technology libraries that GATEMAP supports.

```
